TITLE:

The Influence of Thermoelectric Forces on the Skin Effect in Metal (Vliyaniye termoelektricheskikh sil na skan-effekt v metalle)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol 35, Nr 2, pp 474-478 (USSR)

ABSTRACT:

Formulae are deduced for the surface resistance in consideration of thermoelectric forces. The following system of equations serves as a basis:

$$\text{curl } \vec{H} = \frac{4}{c} \vec{j}; \text{curl } \vec{E} = - \frac{1}{c} \frac{d\vec{H}}{dt}; c \frac{\partial \theta}{\partial t} + \text{div } \vec{q} = 0;$$

$$E_i = Q_{ik} j_k + \alpha_{ik} \partial \theta / \partial x_k; q_i = T \alpha_k j_k - \chi_{ik} \partial \theta / \partial x_k$$

where θ is the high-frequency addition to the average temperature T of the sample, c - the specific heat of the metal, \vec{q} the heat current, χ_{ik} - the resistance tensor, Q_{ik} - the thermal conductivity tensor, and α_{ik} - the tensor of the thermoelectrical coefficients. ($\alpha_{ik} = \alpha_{ki}$).

Card 1/2

SCV/86-34-2-23/60

The Influence of Thermoelectric Forces on the Skin Effect in Metal

For the surface impedance it holds that $\xi_x = E_x(0)/H_y(0)$ and $\xi_y = -E_y(0)/H_x(0)$; $\xi_x = \xi_{0x} = \sqrt{\omega \sigma_{xx}/4\pi i} = \sqrt{\omega \sigma_{\perp}/4\pi i}$; ($\sigma_{\perp} = \sigma_{22} = \sigma_{33}$; $\sigma_{11} = \sigma_{\parallel}$) and ξ_y is decomposed into ξ_y^{ad} and ξ_y^{isoth} , for which equations are deduced as well. In the case of isotropy $\xi = 1/\sqrt{\epsilon - \sin^2 \phi}$ and $\xi^{\text{isoth}} = \sqrt{\epsilon - \sin^2 \phi}/\epsilon$ is obtained, and for ξ^{ad} a considerably more complicated expression is found, the first term of which is equal to the expression for ξ^{isoth} . In conclusion, the authors express their gratitude to L. D. Landau for his valuable discussions. There are 2 references, 2 of which are Soviet.

Khaletnikov, I. M., Doctor of Physical and Mathematical Sciences
Investigations of Low-temperature Physics (Izslodovaniya po
fizike nizkikh temperatur)

Vestnik Akademii nauk SSSR, 1959, Nr. 2, pp. 98-100 (USSR)

The 5th All-Union Conference on this problem took place in Tbilisi from October 27 to November 1, 1958. It was attended by physicists from Moscow, Khar'kov, Leningrad, Tbilisi, Sverdlovsk, and Ryev. 4 fields of low-temperature physics were discussed: superfluidity of liquid helium II, superconductivity, antiferromagnetism, magneto-resistive effect. The following reports and communications were heard: A. A. Abrikosov, G. P. Gor'kov reported on the investigation of the properties of superconductive alloys. A. A. Abrikosov, R. G. Kuz'min, V. M. Tsukernik, A. A. Khaletnikov spoke of properties of superconductors in the high-frequency magnetic field. D. N. Zhurav, V. M. Tsukernik, A. A. Khaletnikov spoke of properties of superconductors for determination of the influence exerted by the Coulomb (Kulom) interaction of charges on superconductivity. V. V. Tolmachev explained the nature of the so-called collective excitations of the Bose type in superconductors. D. N. Zhurav, Ya. A. Tsukernikov spoke of the thermodynamics of superconductors and R. G. Kuz'min, V. M. Tsukernik spoke of the thermal conductivity of superconductors. In V. Shadrin, V. P. Ginzburg reported on experimental work with superconductors. V. V. Tsukernik spoke of the measurement of the anisotropy of thermal conductivity in the superconductive state. In a series of reports problems of the superfluidity of helium were discussed, which was discovered in 1938 by P. L. Kapitza and the theory of which was set up in 1941 by L. D. Landau. The properties of rotating helium, laboratory investigation of the properties of rotating helium, V. M. Tsukernik spoke of the effect of the formation of the boundary between superfluid and non superfluid helium. G. N. Voz'man, collaborator of the Institut fizicheskikh problem (Institute of Physical Problems) investigated the properties of the so-called jump in temperature of Kapitza. I. M. Lifanits, V. M. Tsukernik investigated galvanomagnetic phenomena in strong magnetic fields for metals with open Fermi surfaces. E. Ye. Alekseyevskiy, Ya. P. Gaydakov experimentally investigated the resistance anisotropy of solid microcrystals in the magnetic field. L. S. Kim, S. G. Lazarev spoke of the properties of a temperature anisotropy in the structure theory of metallic compounds. R. L. Abrikosov reported on the structure theory of metallic compounds. A. A. Khaletnikov, V. M. Tsukernik reported on the weak ferromagnetism in antiferromagnetic samples of MnCO_3 . E. M. Kuz'min, V. M. Tsukernik investigated the magnetic anisotropy of the antiferromagnetic microcrystals CuSO_4 and $\text{CuSO}_4 \cdot \text{H}_2\text{O}$. A. A. Khaletnikov reported on neutronographic investigations of antiferromagnetism. Ya. I. Kozlovskiy and collaborators reported on the susceptibility of nickel and nickel-copper alloys at low temperatures. R. I. Lizenov, V. M. Tsukernik reported on kinetic phenomena in ferromagnetism at low temperatures. A. A. Khaletnikov, V. M. Tsukernik, and S. P. Fel'dman reported on the investigation of the magnetic anisotropy of ferromagnetic dielectrics at low temperatures. E. I. Shadrin spoke of observation results of paramagnetic resonance by carbons in the $\text{TiSO}_4 \cdot 6\text{H}_2\text{O}$ nitrate. G. A. Khaletnikov gave a theoretical analysis of the orientation of the nuclear spin in the Overhauser (Overhauser) effect in nonmetals. B. N. Sanyalov, V. M. Tsukernik and collaborators reported on obtaining orientated nuclei. E. V. Buzikova, R. L. Kogan and J. C. Lazarev showed that hydrogen impurities in solid state have a magnetic moment. V. M. Tsukernik, S. G. Lazarev, E. M. Shadrin, V. I. Kozlovskiy and V. I. Kozlovskiy detected polymorphous in a number of salts at low temperatures. E. I. Andronikashvili, V. P. Pashkov and M. P. Kalik reported on the stage of development of foreign scientific research work in the field of low-temperature physics. At the end of the Conference R. L. Kapitza spoke of his successful development of investigations in the field of low-temperature physics. The participants of the Conference visited the Institut fiziki Akademii nauk Gruzinskoy SSR (Physics Institute of the Academy of Sciences of the Gruzinskaya SSR) and the Physics Faculty of Tbilisi University as well as the building of the new research atomic reactor near Tbilisi.

TITLE:

On the Phenomenological Theory of the Kinetic Processes in Ferromagnetic Dielectrics (K fenomenologicheskoy teorii kineticheskikh protsessov v ferromagnitnykh dielektrikakh)
II. The Interaction of Spin Waves With Phonons
(II. Vzaimodeystviye spinovykh voln s fononami)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 36, Nr 1, pp 224-232 (USSR)

ABSTRACT:

The spin waves have to be described by the vector of the density of the magnetic moment $\vec{M} = \vec{M}(\vec{r}, t)$ by the deformation tensor $u_{ik} = (1/2) (\partial u_i / \partial x_k + \partial u_k / \partial x_i)$ where $u = u(\vec{r}, t)$ denotes the vector of displacement. In this case, the interaction Hamiltonian will be the sum of all components in the expansion of the energy of the ferromagnetic with respect to the powers of M_i , $\partial M_i / \partial x_k$, and u_{ik} : $\gamma_{iklm} \int M_i M_k u_{lm} dv$,

$\lambda_{iklmrs} = \int \frac{\partial M_i}{\partial x_k} \frac{\partial M_l}{\partial x_m} u_{rs} dv$. The first of these terms corresponds

Card 1/3

to the energy of magnetostriction. The interaction Hamiltonian

On the Phenomenological Theory of the Kinetic Processes in Ferromagnetic Dielectrics. II. The Interaction of Spin Waves With Phonons

SOV/56-56-1-30/52

is written down as $H_{\text{interaction}} = H_{\text{magnetostriction}} + H_{\text{exchange}}$,
where $H_{\text{interaction}} = \gamma \int M_i M_k u_{ik} dv$,

$$H_{\text{exchange}} = \lambda_1 \int \frac{\partial M_1}{\partial x_i} \frac{\partial M_1}{\partial x_k} u_{ik} dv + \lambda_2 \int \frac{\partial M_1}{\partial x_i} \frac{\partial M_1}{\partial x_i} u_{kk} dv.$$

In the second part of the paper the production and the absorption of phonons by spin waves are calculated. The authors also investigate the energy transfer from spin waves to phonons. The spin waves and the phonons are described by equilibrium distribution functions of the Bose (Boze) type for different temperatures. The coefficient of heat transfer for the activation process of the emission and absorption of phonons decreases exponentially with temperature. The third part of the present paper deals with the annihilation of 2 spin waves with production of a phonon and with the decay of a phonon into 2 spin waves. These processes are due to the magnetostriction part of the Hamiltonian. Practically at any temperature above μMo , production and absorption of phonons

Card 2/3

On the Phenomenological Theory of the Kinetic
Processes in Ferromagnetic Dielectrics. II. The Interaction
of Spin Waves With Phonons

SOV/56-36-1-30/62

play the most important part among the one-phonon processes. The two-photon processes are described by the square terms of the expansion of the energy of the ferromagnetic with respect to the powers of the deformation tensor. There are 2 types of such processes: scattering of a phonon on a spin wave (or vice versa) and emission (or absorption) of 2 phonons by a spin wave. Finally, the time necessary for the establishment of equilibrium (relaxation time) between spin waves and phonons is calculated. There are 5 Soviet references.

TITLE:

Nonresonance Absorption of the Energy of a Variable Magnetic Field by a Ferromagnetic Dielectrics

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,
Vol 37, Nr 3 (9), pp 823-832 (USSR)

ABSTRACT:

A ferromagnetic substance may absorb the energy of a variable magnetic field in various ways: either the magnetic field (the amplitude of which is to be small, $H' \sim e^{-i\omega t}$) is polarized perpendicular to the equilibrium magnetic moment, in which case the magnetic field turns the moment without changing its value, or the field is polarized in the direction of the moment, in which case a superposed magnetization occurs, i.e. the absolute value of the magnetic moment is varied. In both cases dissipative processes are caused, which are interrelated with the interaction of spin waves, both among themselves, and also with phonons (it is assumed that the dielectric substance is magnetized up to saturation). In the present paper the authors confine their attention to those in which the variable magnetic field (frequency ω) is polarized in the direction of the

Card 1/4

Nonresonance Absorption of the Energy of a Variable
Magnetic Field by Ferromagnetic Dielectrics

SOV/56-37-3-35/62

equilibrium moment. Calculation of absorption is then reduced to calculation of the imaginary part of longitudinal magnetic susceptibility $\mu_{||} = \mu'_{||} + i\mu''_{||}$. The complex character of the relaxation processes in ferromagnetic dielectrics leads to a complex frequency dependence $\mu''_{||}(\omega)$. The authors proceed from the simple model, in which the ferroelectric body is considered to have a magnetic moment, the vibrations of which propagate in form of spin waves. This is justified at sufficiently low temperatures, when the vibrations of one of the magnetic sublattices are not excited by the others. The theory of spin waves may be applied to real bodies, e.g. to ferrites the semiconductor properties of which at low temperatures are insignificant (the number of free electrons with decreasing temperature tends exponentially towards zero). The first part of this paper deals with the low frequency range, i.e. ω is much smaller than the reciprocal spin-spin relaxation time τ_{ss} : $\omega\tau_{ss} \ll 1$. The following is obtained for the imaginary part of the longitudinal magnetic susceptibility after all frequency- and temperature ranges have been dealt with in detail:

Card 2/4

Nonresonance Absorption of the Energy of a Variable
Magnetic Field by a Ferromagnetic Dielectrics

SOV/56-37-3-35/62

$$\mu'' \sim \begin{cases} \frac{M_o \mu_c}{\theta_c} \left(\frac{T}{\theta_c} \right)^{1/2} \frac{\omega \tau_{sl}}{1 + \omega^2 \tau_{sl}^2}, & \omega \sqrt{\tau_{sl} \tau_{ss}} \ll 1, \quad T \ll T_o \\ \frac{\mu_o M_o}{\theta_c} \left(\frac{T}{\theta_c} \right)^{1/2} \frac{\omega \tau_{ss}}{1 + \omega^2 \tau_{ss}^2}, & \omega \sqrt{\tau_{sl} \tau_{ss}} \gg 1, \quad T \ll T_o \\ \frac{\hbar \omega}{\mu_o M_o} \frac{1 + \omega^2 \tau_2^2}{(1 + \omega^2 \tau_1^2)^2 + \omega^2 \tau_3^2}, & \omega \tau_{ss} \ll 1, \quad T \gg T_o \end{cases}$$

Here $T_o \sim \mu_o M_o (\theta_c / \mu_o M_o)^{3/7}$, τ_{sl} denotes the spin-lattice relaxation time. The second part deals with high frequencies ($\omega \gg 1/\tau_{ss}$), the Hamiltonian of the interaction between field and spin being set up according to Kaganov (Ref 2):

$\mathcal{H}_{int} = \mu \int \hat{H}_z \hat{a}^*(\vec{r}) \hat{a}(\vec{r}) d\vec{r}$. If ω tends towards ∞ , then magnetic susceptibility tends towards unity, and its imaginary part towards zero. For the frequency dependence of μ'' at very high

Card 3/4

Nonresonance Absorption of the Energy of a Variable
Magnetic Field by a Ferromagnetic Dielectrics

SOV/56-37-3-35/62

frequencies it holds that $\mu'' \approx \frac{8\sqrt{2}}{15} \frac{u^2}{a^3} \frac{(2\pi\mu H_0)^2}{\theta_c^{3/2} (H\omega)^{3/2}}$,

$(H\omega \gg \frac{\lambda}{\tau_{ss}}, T, \mu H_{eff})$. Thus, μ'' decreases inversely

proportionally with $\omega^{3/2}$ and is independent of temperature.
The authors thank V. G. Bar'yakhtar for valuable discussions.

(USSR)

ABSTRACT:

This Conference took place from October 27 to November 1 at Tbilisi; it was organized by the Odeleniye fiziko-matematicheskikh nauk Akademii Nauk SSSR (Department of Physico-mathematical Sciences of the Academy of Sciences, USSR), the Akademiy Nauk Gruzinskoy SSR (Academy of Sciences, Georgian SSR), and the Tbilisitskiy gosudarstvennyy universitet (Tbilisi State University). The Conference was attended by about 300 specialists from the USSR, Georgia, Armenia, Azerbaijan, Uzbekistan, and Tadzhikistan as well as by a number of young Chinese scientists who were present working in the USSR. About 50 lectures were delivered and which were divided according to the following topics:

IV. Magnetism.
A. S. Borovik-Romanov (IPF) delivered a report on investigations carried out of the anisotropy of the weak ferromagnetism in monoclinic samples of the antiferromagnetic MnCO_3 (the effect of anisotropy was predicted by the thermodynamic theory developed by Nyezhinskii). In the course of the discussion A. I. Khanov (IPF) spoke about neutronographic investigations carried out of the magnetic structure of MnCO_3 and FeCO_3 at low temperatures. P. L. Kaplanchuk (IPF) stressed the importance of the method based upon the theory of the Hall effect in the study of the magnetic anisotropy of the antiferromagnetic CuSO_4 and FeSO_4 monoclinic crystals. Ye. A. Purov (IPF AN SSSR, Sverdlovsk) spoke about his theoretical investigations of the magnetisability, the susceptibility, the specific heat, and the resonance frequencies of antiferromagnetics and ferromagnetics. A. I. Rudovskiy and Ye. A. Rudovskiy (IPF) spoke about measurements of the electric moments of iron in magnetic fields in a wide temperature range with simultaneous plotting of the magnetization curves. M. V. Tikhonchikov (IPF AN SSSR) spoke about measurements of magnetization and the Hall effect of polycrystalline samples of nickel and Ni_2Mn at low temperatures. Ye. I. Kondratyuk, V. Bode, B. Gryn and Ching, Shu-chun (SCU) gave a report on susceptibility measurements on nickel and its alloys with copper at low temperatures. T. I. Sandak (TGU) spoke about the anisotropy of the paramagnetic resonance of Ti^{3+} in ferrous sulfate at temperatures of liquid hydrogen. M. I. Kaganov and V. M. Zerkovskiy (IPF) dealt with the kinetic phenomena in ferromagnetics at low temperatures and with calculation of relaxation times. A. I. Akhlyuter, V. Shchegolev and P. A. Belashchuk (IPF) carried out a theoretical investigation of the relaxation of the magnetic moment in ferromagnetics; Vlasov (IPF AN SSSR) showed that a highly polarized elastic (ultrasonic) wave of a frequency of 10^7 cycles when passing through a ferromagnetic substance in the direction of the magnetic field, is subjected to turn of the polarization plane of the order of $10^{-3} - 10^{-4}$ radians/cm. M. I. Kaganov pointed out that in this connection yet another phenomenon may be observed, namely the resonance absorption of ultrasonics if the wavelength is equal to the radius of the Larmor orbit of the electron. V. V. Vasilovskiy, V. Vasilovskiy, and the most interesting facts.

EO32/E414

Theory of Relaxation Processes in Antiferromagnetics

The notation is defined in the previous paper by the present authors (Ref.3). The processes considered are: (a) combination of two spin waves into one, and (b) collision of two spin waves. The probability of other processes, for example combination of three spin waves into one, have zero probability since energy and momentum conservation laws cannot be satisfied at the same time. It is found that the mean probabilities for the above two processes are respectively given by

$$\bar{W}_3 \approx \frac{\omega_c}{h} \left(\frac{\mu_0 M_0}{\omega_c} \right)^{5/2} \frac{T}{\omega_c}^3 \quad (3)$$

$$\bar{W}_4 \approx \frac{\omega_c}{h} \left(\frac{T}{\omega_c} \right)^5 \quad (4)$$

Comparison of these two probabilities shows that in the above

TITLE:

Nonresonance Absorption of the Energy of an Alternating
Magnetic Field by a Ferromagnetic Dielectric. II

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,
Vol. 38, No. 4, pp. 1320 - 1325

TEXT: In part I of the present paper, the nonresonance absorption of the energy of an alternating magnetic field by a ferromagnetic dielectric has already been investigated on the assumption that this field is polarized in the direction of the axis of easiest magnetization. The case is now dealt with, in which the field is polarized perpendicular to this axis. These two cases are described as longitudinal and transverse fields. Contrary to what is the case in a longitudinal field, energy absorption may occur in a transverse field even if no dissipative processes occur, but when the field frequency agrees with the ferromagnetic resonance frequency. Neither resonance nor the effects connected with it are considered. The results obtained here relate to frequencies

Card 1/3

B006/B056

that are distant from resonance. The dissipative processes connected with the energy absorption are caused by the interaction between the magnetic field and the spin waves. The authors assume (like in Ref. 1) that the ferromagnetic dielectric is magnetized up to saturation at a given temperature, i.e., that it may be considered to be a single-domain sample. The sample is also considered to be sufficiently pure, so that impurity effects may be neglected. It is shown that the nonresonance absorption of magnetic field energy is connected with the forming of two spin waves as a result of a "collision" between a photon and a spin wave. Besides, an absorption of the photon in higher perturbation-theoretical approximations is possible due to processes in which a large number of spin waves participate. The most important process in this case is one of the fifth order, which occurs in second perturbation-theoretical approximation. The coefficient of the absorption of magnetic field energy $\Gamma = Q \left(\frac{h\omega}{8\pi} V \right)^{-1}$ is now investigated, where Q denotes the amount of energy absorbed per second within the entire sample volume. X

One obtains $\Gamma = \frac{1}{32\pi^2} \frac{\omega^2 T^2}{\mu M_0 \theta_c^3} \omega (1 - e^{-\hbar\omega/T}) I(\eta, \nu)$, where $\eta = \mu H_e/T$ and

$\nu = \hbar\omega/T$; the function $I(\eta, \nu)$ is represented as an integral equation by (13) and (13'). These equations are integrated for the special cases of low frequencies ($\nu \ll 1, \eta$), resonance frequency ($\nu = \eta$), and high frequencies ($1 \gg \nu \gg \eta$; $\nu \gg 1 \gg \eta$; $\eta \gg \nu \gg 1$; $\nu \gg \eta \gg 1$). The resulting asymptotic values of the integrals are used to determine approximate formulas for Γ in the various special cases. The authors thank A. I. Akhiezer and V. G. Bar'yakhtar for discussions. PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,
Vol. 39, No. 2(8), p. 518

TEXT: In an earlier paper, the authors calculated the absorption coefficient of a variable magnetic field polarized perpendicular to the axis of easiest magnetization. The Hamiltonian used in that case took only the exchange interaction into account. Later, Tsukernik showed that in this case only resonance absorption of a homogeneous magnetic alternating field may take place, since the total magnetic moment commutes with the Hamiltonian of the system; the results of the earlier paper (Ref. 1) are therefore wrong. The error is related to the fact that in the calculation of the matrix elements of the transition, the authors restricted themselves to the first approximation of the perturbation theory. A consideration of the second approximation shows that the matrix

Dielectric

S/056/60/039/002/044/044
B006/B070

element vanishes to the corresponding accuracy. The non-resonant absorption of the homogeneous field is related to the relativistic interactions in the system (dipole-dipole interaction, anisotropy energy, etc.). These problems will be considered in a later paper. Here, the authors give only a formula for the coefficient of absorption of a transverse magnetic field whose frequency is considerably smaller than that of the spin wave in the case of a zero quasi-momentum. The absorption described by this formula is due to a decay of a photon into two spin waves with oppositely directed quasi-momenta. There is 1 Soviet reference. ✓

TITLE: The spin phonon width of lines of antiferromagnetic resonance

SOURCE: Fizika tverdogo tela, v. 6, no. 3, 1964, 818-826

TOPIC TAGS: spin phonon interaction, magnetic resonance, magnetization precession, exchange interaction, antiferromagnetism

ABSTRACT: The authors have examined the relaxation of the uniform precession of magnetization in a uniaxial antiferromagnetic as a consequence of interaction between spin waves and phonons (both acoustical and optical). They show that the relaxation processes of creating (or absorbing) an acoustical phonon by a spin wave, by virtue of the law of conservation of energy and momentum, may take place only at frequencies of

$$\omega_0 > \omega_0^{\text{gr}} = \frac{\sqrt{3}h_A v}{a},$$

where ω_0 is the frequency of antiferromagnetic resonance, h_A is the field of

Card 1/2

ACCESSION NR: AP4019844

anisotropy, v the velocity of sound, and a the lattice constant. The interaction is an exchange process. The width of the line has been computed for any temperature. At rather high frequencies of antiferromagnetic resonance, $\omega_0 > \omega_0^{gr}$, where normally $\omega_0^{gr} \sim 2 \cdot 10^{12}$ sec⁻¹deg, the spin-phonon line width at low temperatures proves to be much greater than spin-spin line width. At frequencies of $\omega_0 < \omega_0^{gr}$, the spin-phonon width is small compared to spin-spin width, except for regions of very low temperatures ($T < 10^{-3}$ K). Orig. art. has: 39 formulas.

TITLE: Off-resonance absorption of a variable magnetic field by ferromagnetic dielectrics at low temperatures

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 25, no. 11, 1961, 1346-1351

TEXT: The authors studied the absorption of an h.f. magnetic field whose plane of circular polarization is perpendicular to the equilibrium magnetic moment of the ferromagnetic. They consider absorption without resonance, which can only occur by the interaction of spin waves with one another and with phonons. The calculations are made for temperatures considerably below the Curie point θ_c . The absorption coefficient Γ of the magnetic field is given as $\Gamma = \frac{8\pi k_B}{h^2 V} \sum \{w_{if} - w_{fi}\}$, where w_{if} is the probability of direct, and w_{fi} of inverse, transition. The absorption

coefficient due to spin-spin interaction is evaluated for two limiting cases: (1) High temperatures $T \gg \epsilon_0$ (but still $T \ll \theta_0$):

$$\Gamma_{ss} \approx \begin{cases} A_1 \omega \left(\frac{w}{\theta_c} \right)^2 \frac{\mu M_1}{\theta_c} \cdot \frac{\hbar \omega T^2}{\epsilon_0^3}, & \hbar \omega \ll \epsilon_0, \\ A_2 g M_0 \left(\frac{w}{\theta_c} \right)^2 \frac{T^2}{\hbar \omega \theta_c}, & \epsilon_0 \ll \hbar \omega \ll T, \\ \frac{4}{15} \sqrt{\frac{\pi}{2}} \zeta(3/2) g M_0 \left(\frac{w}{\theta_c} \right)^2 \frac{T^{3/2}}{(\hbar \omega)^{1/2} \theta_c}, & \hbar \omega \gg T, \end{cases} \quad (17)$$

where $w = \frac{\mu^2}{a^3}$ is the dipole-dipole interaction energy; $A_1 \sim A_2 \sim 10^3$.

(2) Low temperatures ($T \ll \epsilon_0$):

Card 2/4

Off-resonance absorption of a...

30053/048/61/025/011/007/031
B100/B136

$$\Gamma_{ss} \approx \begin{cases} B_1 \omega \left(\frac{w}{\theta_c} \right)^2 \frac{\mu M_0}{\theta_c} \frac{\hbar \omega T^{1/2}}{\varepsilon_0^{1/2}} e^{-\frac{\pi \varepsilon_0}{T}}, & \hbar \omega \leq \varepsilon_0, \\ \frac{4}{15} \sqrt{\frac{\pi}{2}} \omega \left(\frac{w}{\theta_c} \right)^2 \frac{\mu M_0}{\theta_c} \left(\frac{T}{\varepsilon_0} \right)^{1/2} e^{-\frac{\pi \varepsilon_0}{T}}, & \hbar \omega \geq \varepsilon_0, \end{cases} \quad (18)$$

where

$$B_1 = \frac{15\pi^{1/2}}{8\sqrt{2}} \left\{ 121 + \frac{1}{15} \left[\left(\frac{2\beta}{\pi} - \frac{2}{3} \right)^2 + \frac{121}{45} \right] \right\} + \frac{4}{15} \sqrt{\frac{\pi}{2}} \approx 10^4$$

$\varepsilon_0 = \mu H_0 + \beta \mu K_0$ where H_0 denotes the permanent magnetic field along the axis of easiest magnetization, K_0 the equilibrium magnetic moment, β the anisotropy constant, a the lattice constant, $\mu = g\hbar$, g the gyromagnetic ratio. The results for spin-lattice interaction show that these contributions to the overall absorption coefficient are considerably smaller than the contribution due to spin-spin interaction. The considerations have been made for perfect ferromagnetics without

TITLE: An absorption mechanism for a longitudinal magnetic field by a ferromagnetic dielectric

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 25, no. 11, 1961, 1352-1353

TEXT: The ferro-dielectric absorption of the energy of a variable magnetic field polarized along the axis of easiest magnetization was studied in detail in a previous paper (Ref. 1: Zh. eksperim. i teor. fiz., 37, 823 (1959)). The absorption of the field at $\omega\tau_{ss} \ll 1$, where τ_{ss} is relaxation time, was calculated with the aid of the kinetic equations for the distribution function of the spin waves. The calculations were made for temperatures T considerably below Curie point θ_c . At high frequencies, absorption is chiefly determined by the disintegration of a photon into two spin waves with opposite momenta. This process was also considered in the above paper. It was pointed out, however, that a photon will only

Card 1/4

S/048/61/025/011/008/031
B108/B138

An absorption mechanism for a...

disintegrate into two spin waves at frequencies ω greater than $\frac{2\varepsilon_0}{\hbar}$, where ε_0 is the energy of a zero-momentum spin wave. The wide range $\frac{1}{\tau} \ll \omega < \frac{2\varepsilon_0}{\hbar}$ has not been considered as yet. Absorption in this range is the subject of the present paper. In the lowest spin-wave approximation, the Hamiltonian for spin wave interaction with one another and with a longitudinal magnetic field is $H' = H_{\text{int}} + H_h$ (1) where $H_{\text{int}} = \sum_{123} \Phi_{123} a_1^+ a_2^+ a_3 + \text{complex conjugate}$ (2) and $H_h = \frac{1}{2} \mu h_0 (e^{i\omega t} + e^{-i\omega t}) \sum_k a_k^+ a_k$ (2'). h_0 denotes the amplitude of

the variable field. The other notations may be found in Ref. 2 (Akhiezer et al., Uspekhi fiz. nauk, 71, 533 (1960)). In the approximation in question (second approximation in perturbation theory), strong exchange interaction does not contribute to absorption. It can be seen from the (1) and (2) that the transition matrix elements that are linear with respect to the variable field are nonvanishing only in second and higher perturbation-theoretical approximation. The corresponding lowest order processes are: (a) merging of a photon and a spin wave, which form two spin waves and (b) merging of two spin waves and one photon to form one spin wave. The

Card 2/4

An absorption mechanism for a...

calculation of the appropriate absorption coefficients Γ_a and Γ_b is similar to that given in detail in Ref. 3 (Kaganov M. I., Tsukernik V. M., present number of this periodical, p. 1346). In this article, only the final results for the total absorption coefficient $\Gamma = \Gamma_a + \Gamma_b$ are given, with precision up to a numerical factor of the order of unity. At high temperatures ($\epsilon_0 \ll T \ll \theta_c$)

$$\Gamma \sim \begin{cases} gM_0 \frac{w^2}{\epsilon_0 \theta_c} \left(\frac{T}{\theta_c} \right)^2, & \frac{\hbar}{\tau_{ss}} \ll \hbar\omega \ll \epsilon_0, \\ gM_0 \frac{w^2}{\hbar\omega \theta_c} \left(\frac{T}{\theta_c} \right)^2, & \epsilon_0 \ll \hbar\omega \ll T, \\ gM_0 \frac{w^2}{\theta_c^{3/2} (\hbar\omega)^{1/2}} \left(\frac{T}{\theta_c} \right)^{1/2}, & T \ll \hbar\omega \ll \theta_c. \end{cases}$$

At low temperatures ($T \ll \epsilon_0$)

Card 3/4

An absorption mechanism for a...

30064 S/048/61/025/011/008/031
B108/B138

$$\Gamma \sim \begin{cases} gM_0 \frac{w^2}{\theta_c^2} \left(\frac{\epsilon_0}{\theta_c} \right)^{1/2} \left(\frac{T}{\theta_c} \right)^{1/2} e^{-\frac{3\epsilon_0}{T}}, & \frac{\hbar}{\tau_{11}} \ll \hbar\omega \ll \epsilon_0, \\ gM_0 \frac{w^2}{\theta_c^{1/2} (\hbar\omega)^{1/2}} \left(\frac{T}{\theta_c} \right)^{1/2} e^{-\frac{\epsilon_0}{T}}, & \hbar\omega \gg \epsilon_0. \end{cases}$$

Comparison of the results obtained with the absorption coefficient due to the disintegration of one photon into two spin waves (Ref. 1) shows that the processes considered in this paper are only effective at $\hbar\omega < 2\epsilon_0$.

TITLE: High-frequency magnetic susceptibility of uniaxial ferromagnetic crystal in a longitudinal magnetic field

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41, no. 1(7), 1961, 267 - 271

TEXT: Susceptibility dispersion of an antiferromagnetic material is mainly due to rotation of the magnetic moments of the sublattices in a magnetic field. The imaginary part of χ exhibits a resonance character in this case: resonance frequency coincides with the natural rotation frequencies of the system of moments. These frequencies have been computed for various equilibrium configurations by C. Kittel (Phys. Rev., 85, 329, 1952) and Ye. A. Turov (ZhETF, 34, 1009, 1958). In an earlier paper (ZhETF, 24, 524, 1958), the authors of the present work have computed the h-f susceptibility of a uniaxial antiferromagnetic body without magnetic field. If the magnetic field is strong enough, the equilibrium configuration of the sublattice moments may change, which

Card 1/7

26424

S/056/61/041/001/019/021

B102/B231

High-frequency magnetic ...

would result in a change of the dispersion character. Starting from the Landau-Lifshits equations for the motion of the sublattice moments, the h-f susceptibility tensor of an antiferromagnetic body is computed for various values of the constant magnetic field strength, that is, for various equilibrium configurations of the moments. The results permit to draw conclusions from h-f measurements as to the equilibrium structures and the transitions between them. The uniaxial antiferromagnetic body is assumed to have two sublattices and to be positioned in a homogeneous, constant and in a weak and variable (frequency ω) magnetic field. The motion of the moments due to field action is described by

$$\partial \vec{M}_s / \partial t = g [\vec{M}_s \vec{H}_e^{(s)}] - (\gamma / M_s^2) [\vec{M}_s [\vec{M}_s \vec{H}_e^{(s)}]] \quad (1),$$

where \vec{M}_s is the magnetization vector of the s-th sublattice, M the sublattice magnetization which is assumed to be constant, g the gyromagnetic ratio, γ the relaxation constant, $\vec{H}_e^{(s)}$ the effective field acting upon the s-th sublattice: $\vec{H}_e^{(s)} = -\partial \chi / \partial \vec{M}_s$, where χ stands for the energy density of the antiferromagnetic body:

Card 2/7

High-frequency magnetic ...

26424
S/056/61/041/001/019/021
B102/B231

$$\mathcal{H} = \alpha M_1 M_2 - \frac{1}{2} \lambda [(M_1 n)^2 + (M_2 n)^2] + \eta (M_1 n) (M_2 n) - H (M_1 + M_2). \quad (3)$$

Here, α is the constant of exchange interaction ($\alpha > 0$), λ and η represent the anisotropy constants which are assumed to be positive; n is the unit vector in the direction of the axis of the antiferromagnetic body. Using the notation stated hereinafter: $H_1 = \sqrt{(\lambda + \eta)(2\alpha - \lambda + \eta)} M$,

$$H_2 = \sqrt{(\lambda + \eta)(2\alpha + \lambda + \eta)} M, H = H_3 = (2\alpha - \lambda + \eta) M, \text{ and}$$

$$H_4 = [\lambda(2\alpha - \lambda + \eta)^2 / (2\alpha + \lambda + \eta)]^{1/2} M \quad (H_4 < H_1; H_2 - H_4 \text{ is the width of}$$

the hysteresis loop of the antiferromagnetic body), the following cases are subjected to investigation: 1) $H < H_1$. m_{\pm} is equal to $\chi_{\pm} h_{\pm}$, where

$h_{\pm} = h_x \pm i h_y$, $m_{\pm} = m_x \pm i m_y$, \vec{h} stands for the h-f magnetic field, and \vec{m} for the variable part of the entire magnetic moment. With

$$\Omega^2 = (g^2 M^2 + \gamma^2) (\lambda + \eta) (2\alpha + \lambda + \eta) - \gamma^2 H^2 / M^2, \quad (5)$$

$$\Omega_1^2 = 2 (g^2 M^2 + \gamma^2) (\lambda + \eta).$$

Card 3/7

26424
S/056/61/041/001/019/021
B102/B231

High-frequency magnetic ...

the following is obtained:

$$\chi_{\pm} = \frac{\Omega_1^2 - 2i\omega\gamma}{\Omega^2 - (\omega \mp gH)^2 - 2i\omega\gamma(\alpha + \lambda + \eta)}, \quad \chi_{zz} = 0. \quad (6)$$

The width of the antiferromagnetic resonance lines is thus given by $2\gamma(\alpha + \lambda + \eta)$. With $H = 0$ one has $\chi_+ = \chi_- = \chi_{xx} = \chi_{yy}$. 2) $H_1 < H < H_3$; Here, $\chi_{zz} \neq 0$, and the following is obtained:

$$\chi_{zz}(\omega) = \chi_{zz}(0) \frac{\nu^2 + i\nu\omega}{\nu^2 + \omega^2}; \quad (7)$$

$$\chi_{zz}(0) = 2/(2\alpha - \lambda + \eta). \quad (8)$$

$$\nu = (2\alpha - \lambda + \eta) \gamma \sin^2 \theta = \gamma (1 - H^2/H_3^2) H_3/M.$$

From this, the following is obtained for the behavior of the relaxation time $\tau = 1/\nu$ in the vicinity of the point of second-kind phase transition (with $H \approx H_3$):

$$\tau = \frac{1}{\gamma} \frac{H_3^2}{H_3^2 - H^2}. \quad \text{If } T \text{ is fixed, and } H = H_3 \text{ the following is valid:}$$

Card 4/7

26424
S/056/61/041/001/019/021
B102/B231

High-frequency magnetic ...

$$\tau = \frac{G}{|T_K - T|}, \quad G = M/2\gamma \left| \frac{dH_s}{dT} \right|_{T=T_K} \quad (8''),$$

where T_K is the temperature of phase transition. This means that with the frequency being fixed there is a field or a temperature at which the h-f field (polarized along z) exhibits an absorption maximum whose position and height is dependent on ω . The transverse components are in this case given by

$$\begin{aligned} \chi_{xx} &= \frac{\omega_1^2 - 2i\omega\gamma}{\omega_0^2 - \omega^2 - 2i\alpha\gamma'\omega} \cos^2 \theta, \\ \chi_{yy} &= \frac{1}{\alpha} \frac{\omega_0^2 - 2i\omega\gamma}{\omega_0^2 - \omega^2 - 2i\alpha\gamma'\omega}, \\ \chi_{xy} &= -\chi_{yx} = \frac{2igM\omega \cos \theta}{\omega_0^2 - \omega^2 - 2i\alpha\gamma'\omega} \end{aligned} \quad (9),$$

Card 5/7

26: 2h
S/056/61/041/001/019/021
B102/B231

High-frequency magnetic ...

where

$$\begin{aligned}\omega_0^2 &= (g^2 M^2 + \gamma^2) (4\alpha^2 \cos^2 \theta - 2(\lambda + \eta) \alpha \sin^2 \theta), \\ \omega_1^2 &= 4\alpha (g^2 M^2 + \gamma^2), \quad \gamma' = \gamma [1 + \cos^2 \theta + \frac{1}{2\alpha} (\lambda + \eta) \sin^2 \theta].\end{aligned}\quad (10)$$

3) $H > H_3$, $(\vec{H} \parallel \vec{n})$. Here, the tensor of h-f susceptibility coincides with that of the susceptibility of the uniaxial antiferromagnetic body:

$$\begin{aligned}\chi_{xx}(\omega) &= \chi_{yy}(\omega) = \chi_L(0) \frac{\omega_\phi^2 - i\omega\gamma_\phi}{\omega_\phi^2 - \omega^2 - 2i\omega\gamma_\phi}, \\ \chi_{xy}(\omega) &= -\chi_{yx}(\omega) = \frac{2igM\omega}{\omega_\phi^2 - \omega^2 - 2i\omega\gamma_\phi},\end{aligned}\quad (11),$$

$$\chi_{xz} = \chi_{yz} = \chi_{zx} = 0,$$

$$\begin{aligned}\chi_L(0) &= 2M/(H + (\lambda - \eta)M), \\ \omega_\phi^2 &= g^2 [H + (\lambda - \eta)M]^2 (1 + \gamma^2/g^2 M^2), \\ \gamma_\phi &= \gamma (H/M + \lambda - \eta).\end{aligned}\quad (12).$$

 & + \delta_-(e_{23;k1} - \hbar\omega)].
 \end{aligned}$$

Card 2/4

High-frequency magnetic...

S/056/62/043/003/037/063
B108/B102

with $\left. F_{\alpha} \right|_{t=0} = n_{\alpha} = (e^{\epsilon_{\alpha}/T} - 1)^{-1}$ and $\langle a_{\alpha}^{\dagger} a_{\beta}^{\dagger} a_{\gamma} \rangle \big|_{t=0} = 0$.

$\epsilon_k = \theta_{\text{Curie}} (ak)^2 + \mu H + |B_k|$. At high frequencies it is sufficient to consider the term $-i\omega f_k = L_k h_0$. From this equation the high-frequency magnetic susceptibility of a ferroelectric with one magnetic sublattice can be calculated keeping in mind that magnetization too can be expressed in terms of the spin wave distribution function:

$$V^{-1} \langle M_z \rangle = M_0 - \frac{\mu}{V} \sum_k \langle a_k^{\dagger} a_k \rangle, \quad \langle a_k^{\dagger} a_k \rangle = \text{Sp } \rho a_k^{\dagger} a_k, \quad (6)$$

Thus, $\chi = -\frac{1}{\omega V} \sum_k L_k$. V is the volume of the body. The real part of magnetic susceptibility which is related to dispersion is

$$\text{Re } \chi = \frac{\mu}{\omega V} \sum_k \text{Im } L_k.$$

The predominant term in $\text{Im } L_k$ is the one proportional to $|B_k|^2$. Con-

Card 3/4

S/056/62/043/003/037/063
B108/B102

sidering this and using the symbols $x = \sqrt{\theta_{\text{Curie}}/T} ak$, $\alpha = \hbar\omega/T$,
 $\eta = \mu H/T$, $\gamma = 4\pi\mu M_0/T$ and $w = \mu^2/a^3$ the result is

$$\text{Re } \chi = \frac{w \cdot (\mu M_0)^2}{4T} \left(\frac{T}{\theta_c} \right)^{1/2} \int_0^\pi \sin^2 \theta d\theta \int_{-\infty}^\infty \frac{\text{ch}(y(x)/2)}{y(x)} \frac{x^2 dx}{y^2(x) - a^2/4},$$

$$y(x) = \sqrt{(x^2 + \eta)^2 + \gamma(x^2 + \eta) \sin^2 \theta}.$$

ABSTRACT: A one-dimensional system of spins ($s = 1/2$) with a strongly anisotropic interaction of the immediate neighbors has been examined. The system is assumed to be in a homogeneous magnetic field directed along a given axis. Exact equations have been obtained for the thermodynamic characteristics of the system. It has been shown that at $T = 0$ and an absolute value of the magnetic-field strength H_0 , the magnetic susceptibility has a logarithmic or root nature, dependent, like H_0 , on the relation between the interaction constants. The authors thank V. G. Vaks and A. I. Larkin for valuable discussions. Orig. art. has: 11 formulas. [Based on authors' abstract] [NT]

TITLE: Features of gyromagnetic effect in ferrodielectrics at low temperatures

SOURCE: Zh eksper i teor fiz, v. 50, no. 6, 1966, 1631-1635

TOPIC TAGS: ferromagnetic dielectric, spin wave theory, dipole interaction, magnetic moment, ground state, temperature dependence

ABSTRACT: The author derives in the spin-wave approximation a formula for the temperature part of the mechanical moment of a spin system and shows that in the region of temperatures where the dipole interaction plays an important role, its ratio to the corresponding addition to the magnetic moment differs from the single-electron g factor and depends on the temperature. The approximation employed consists of expanding, with accuracy to quadratic terms, the energy density in powers of a quantity which is small near the ground state in comparison with the magnetization, followed by quantization and averaging with an equilibrium Gibbs distribution. The deduced difference in the temperature dependence of the magnetic and mechanical moments of the spin system is observable in principle with the aid of a gyromagnetic experiment in which the moments are changed as a result of changes in the temperature in the absence of an external field. The author thanks M. I. Kaganov for useful discussions. Orig. art. has: 20 formulas.

TOPIC TAGS: electromagnetic field, field state, field intensity
value, wave function, occupation number, quantum electrodynamics

ABSTRACT: Since a free electromagnetic field can be described in
quantum theory either by giving the photon occupation numbers or
by giving the field strength, the authors consider the problem of
finding states of the electromagnetic field in which the electrical
or the magnetic field strength has a well defined value. The states
of interest are those in which the field strength is given in all of
space at one particular time, so that a complete set of the values
of the electrical (or magnetic) field strength can be chosen in all

Characterization of quinols. I. TSURUKAWA
(Bull. Univ. Asia Central, 1934, No. 10, 49-50).—
Toluquinol and Br₂ in CHCl₃ yield the dibromide, an
oil, readily decomp. to yield 1-chloro-4-methylquinol;
the tetrabromide, m.p. 186°, prepared similarly, yields
di- and tri-bromo-p-anesol when heated above the
m.p., whilst when it is heated with H₂O the product
is 3,6-dibromo-6-methylquinol. The di-, m.p. 93°
(decomp.), and tetra-chloride, m.p. 145°, prepared
analogously, behave similarly to the above bromides,
but are more stable. Epoxidized dibromide, m.p.
108°, tetrachloride, m.p. 183°, dichloride, m.p. 115°,
and tetrachloride, an oil, yield unidentified quinols
when heated.

1ST AND 2ND CROSS		PROCESS AND PROPERTIES INDEX	
<p>CO- Alkylation of phenols with alcohols in the presence of aluminum chloride. II. Alkylation with secondary and primary aliphatic alcohols. I. P. Tsukervanik and Z. N. Nazarova. <i>J. Gen. Chem.</i> (U.S.S.R.) 7, 1023-24 (1937); <i>C. A.</i> 30, 4431. The difficulties of obtaining alkylphenols by catalytic condensation of phenols with secondary alcs. have been overcome by the use of excess AlCl_3 and higher temps. By this method about 70% alkylphenols, contg. small amts. of dialkylphenol ethers, $(\text{R}_2\text{C}_6\text{H}_3\text{OR})$ (I) and alkylphenol ethers $(\text{RC}_6\text{H}_4\text{OR})$ (II), are formed. The proportion of II in the reaction mixt. increases with decrease in the AlCl_3 concn. and temp. The probable mechanism of the condensation is: $\text{ROH} + \text{AlCl}_3 \rightarrow \text{HCl} + \text{AlCl}_2(\text{OR})$; $\text{PhOH} + \text{AlCl}_3 \rightarrow \text{HCl} + \text{PhOAlCl}_2$; $\text{AlCl}_2(\text{OR}) + \text{PhOAlCl}_2 \rightarrow \text{PhOR} + \text{AlCl}_3 + \text{AlCl}_2\text{OH}$. PhOR is then converted to II either by alkylation: $\text{PhOR} + \text{ROH} + \text{AlCl}_3 \rightarrow \text{II} + \text{AlCl}_2\text{OH} + \text{HCl}$, or by rearrangement: $2 \text{PhOR} \xrightarrow{\text{AlCl}_3} \text{II} + \text{PhOH}$ (cf. Smith, <i>C. A.</i> 27, 5067). The alkylated ethers are then converted to alkylphenols by the action of the excess of AlCl_3 or higher temps. either by sapon.: $\text{II} + \text{HCl} \xrightarrow{\text{AlCl}_3} \text{RC}_6\text{H}_4\text{OH} + \text{RCl}$ (Hartmann and Gattermann, <i>Ber.</i> 25, 3531 (1892)), or by rearrangement: $\text{II} + \text{PhOH} \xrightarrow{\text{AlCl}_3}$</p>		<p>10 2RC₆H₄OH; 2 H $\xrightarrow{\text{AlCl}_3}$ RC₆H₄OH + H, (cf. Smith, <i>loc. cit.</i>). Condensation of PhOH with MePhCHOH resulted chiefly in a mixt. of o- and p-MePhC₆H₄OH and a little of EtC₆H₄OH as a result of the isomerization of the alk. radical, which could be effected either by the cleavage of H₂O from the alk. by the action of AlCl_3 or by the isomerization of alkylated phenol ether. The condensation of PhOH with primary alcs. was effected by the same method with 2 mols. of AlCl_3 to 1 mol. of PhOH and 1 mol. of alc. Condensation of MeCHOH with PhOH in petr. ether at 110-20° for 6 hrs. gave 52% p-HOC₆H₄CHMe₂ (III), m. 61°, (the ester m. 71-2°), and about 23% of nonphenolic fraction, b. 225-30°, contg. chiefly p-MeC₆H₄CHOC₆H₄CHMe₂ (IV). Anisole and MeCHOH in petr. ether at 120° for 4 hrs. gave 38% of a mixt. of III and o-isomer, b. 215-17°, and 50% of o- and p-MeOC₆H₄CHMe₂ contaminated by a little IV. The condensation at 130-40° for 5-6 hrs. resulted in 64% of o- and p-HOC₆H₄CHMe₂ and 30% MeOC₆H₄CHMe₂. m-Cresol and MeCHOH heated at 125° for 6 hrs. gave 68% 3,4-HOC₆H₃MeCHMe₂, m. 112°, and 20% 3,4-MeC₆H₃CHOC₆H₃MeCHMe₂, b. 233-5°. PhOH and EtMeCHOH in ligroin</p> <p>see other side →</p>	
<p>ASB-SLA METALLURGICAL LITERATURE CLASSIFICATION</p>			

heated at 120-40° for 6 hrs. gave 52% of EtMeCHC₆H₄OH (o-isomer, b. 229-32°, d₄²⁰ 0.9007, n_D²⁰ 1.5182, M. R. 45.89; p-isomer, b. 235-7°, d₄²⁰ 0.9883, n_D²⁰ 1.518), and 13% EtMeCHOC₆H₄CHMeEt. In the process of distn. the ether is given into the *tert*-butylphenol. Anisole and EtMeCHOH digested on a water bath for 2 hrs. gave 53%

MeOC₆H₄CHMeEt, b. 109-70°, d₄²⁰ 0.9413, n_D²⁰ 1.503, M. R. 51.5, 18% MeOC₆H₄(CHMeEt)₂, b. 140-2°, d₄²⁰ 0.9240, n_D²⁰ 1.498, M. R. 80.72, and 13% HOC₆H₄CHMeEt. PhOH and MePrCHOH allowed to stand at room temp. for 24 hrs. and then heated at 40-50° for 4 hrs. gave 57.5% of phenolic and 11% of nonphenolic fraction. From the phenolic fraction crystd. out EtCHC₆H₄OH, m. 88° (Bz deriv., m. 40-1°); the residue on fractionation gave p-MePrCHC₆H₄OH, b. 150-6° (Bz deriv., b. 255°), and o-isomer, b. 140-50°, d₄²⁰ 0.9881, n_D²⁰ 1.519 (Bz deriv., b. 340-4°). The nonphenolic fraction gave MePrCHC₆H₄OCCHPrMe, b. 230-40°, and (MePrCH)₂C₆H₄OCCHPrMe, b. 245-60°, d₄²⁰ 0.900, n_D²⁰ 1.4919. Anisole and MePrCHOH treated as above afforded MeOC₆H₄CHPrMe, b. 221-50°, d₄²⁰ 0.9284, n_D²⁰ 1.490, and MeOC₆H₄(CHPrMe)₂, b. 245-60°. The condensation of PhOH with MeOH could not be effected. PhOH and also EtOH heated at

120-40° for 6 hrs. gave 62% phenolic and 11% nonphenolic products. The phenolic fraction consisted of 60% EtC₆H₄OH, b. 237°, m. 78-8.5°, and 40% o-EtC₆H₄OH, m. 137°, and the p-isomer, b. 216-20°. The nonphenolic fraction on redistn. was completely converted into EtC₆H₄OH. PhOH and PrOH gave 73.6% o-PrC₆H₄OH, b. 223°, d₄²⁰ 1.0008, and the p-isomer, b. 225-8°, and 17% PrC₆H₄OPr, b. 340-5°; this on standing was converted into PrC₆H₄OH. PhOH and BuOH gave 72% phenolic and 14% nonphenolic products. o-BuC₆H₄OH, b. 233-5°, d₄²⁰ 0.9713; p-isomer, b. 240-60°, d₄²⁰ 0.9781 (Bz deriv., m. 25-6°). PhOH and iso-BuOH gave C₆H₅ and 82% MeCC₆H₄OH, m. 98°. PhOH and iso-AmOH gave 3 amylphenols, of which only Me₂EtCC₆H₄OH, m. 98-90°, was identified. About 25 references. Chas. Blanc

1ST AND 2ND COLUMNS		3RD AND 4TH COLUMNS	
PROCESSES AND PROPERTIES INDEX			
<p>Condensation of alcohols with aromatic hydrocarbons in the presence of anhydrous aluminum chloride. III. Condensation of primary alcohols with benzene and toluene. I. P. Tsuketvansk and G. Vukhova. <i>J. Gen. Chem. (U.S.S.R.)</i> 7:632-6 (1937); cf. C. A. 30:442 and preceding abstr.—The condensation of C_6H_5 and $PhMe$ with primary alcoh. proceeds more difficultly than with secondary alcoh., requiring a large excess of $AlCl_3$ (1.3-2 mols. for 1 mol. of alc.) and longer heating (4-10 hrs.) at higher temps. (110-140°). At optimum conditions 80-94% of mixed alkylated products and no unsubst. hydrocarbons are formed. Greater $AlCl_3$ concn. and higher temps. increase the formation of polyalkyl derivs. The latter as a chief reaction product (cf. Shoemith and McGeehan, C. A. 25:281). $PhMe$ is generally more reactive. With $MeOH$ it gives products of various degrees of alkylation, while C_6H_5 fails to react. The 2-stage condensation (prepn. of Al alcoholate and heating it with C_6H_5 or $PhMe$) resulted in smaller yields of alkylated hydrocarbons. The nature of the diethylphenyl, $Et(C_6H_5)_2$, $Et(C_6H_5)_3$, $Et(C_6H_5)_4$, $Et(C_6H_5)_5$, $Et(C_6H_5)_6$, $Et(C_6H_5)_7$, $Et(C_6H_5)_8$, $Et(C_6H_5)_9$, $Et(C_6H_5)_{10}$, $Et(C_6H_5)_{11}$, GA Condensation of alcohols with aromatic hydrocarbons in the presence of anhydrous aluminum chloride. III. Condensation of primary alcohols with benzene and toluene. I.P.Tsukervanik and G. Vikhrova. J. Gen. Chem. (U.S.S.R.)

10

In the presence of anhydrous AlCl_3 and AlEt_3 , the condensation of primary alcohols with benzene and toluene proceeds by intermediate cleavage of H_2O with the formation of cycloalkenes and cycloalkyl chlorides: $\text{C}_6\text{H}_5\text{OH} + \text{AlCl}_3 \rightarrow \text{C}_6\text{H}_5 + \text{AlCl}_2\text{OH} + \text{HCl}$; $\text{C}_6\text{H}_5 + \text{HCl} \xrightarrow{\text{AlCl}_3} \text{C}_6\text{H}_5\text{Cl}$; $\text{C}_6\text{H}_5 + \text{C}_6\text{H}_5 \xrightarrow{\text{AlCl}_3} \text{Ph-C}_6\text{H}_5$; $\text{C}_6\text{H}_5 + \text{C}_6\text{H}_5\text{Cl} \xrightarrow{\text{AlCl}_3} \text{Ph-C}_6\text{H}_4\text{Cl} + \text{HCl}$. C. B.

the condensation of secondary cyclic alcs. with aromatic hydrocarbons proceeds by intermediate cleavage of H_2O with the formation of cycloalkenes and cycloalkyl chlorides: $\text{C}_6\text{H}_5\text{OH} + \text{AlCl}_3 \rightarrow \text{C}_6\text{H}_5 + \text{AlCl}_2\text{OH} + \text{HCl}$; $\text{C}_6\text{H}_5 + \text{HCl} \xrightarrow{\text{AlCl}_3} \text{C}_6\text{H}_5\text{Cl}$; $\text{C}_6\text{H}_5 + \text{C}_6\text{H}_5 \xrightarrow{\text{AlCl}_3} \text{Ph-C}_6\text{H}_5$; $\text{C}_6\text{H}_5 + \text{C}_6\text{H}_5\text{Cl} \xrightarrow{\text{AlCl}_3} \text{Ph-C}_6\text{H}_4\text{Cl} + \text{HCl}$. C. B.

isomer (identified as $m\text{-C}_6\text{H}_4(\text{CO}_2\text{Me})_2$, m. 62°) and $sym\text{-C}_6\text{H}_4(\text{CO}_2\text{Me})_2$, m. 68° , identified as tri-Me trimesate, m. 144° . PhMe is less reactive, requiring more AlCl_3 and a large excess of PhMe. $\text{C}_6\text{H}_5\text{OH}$ (70 g.), 80 g. AlCl_3 and 200 cc. PhMe gave 72% of a fraction, b.p. $254-60^\circ$, $d_4^{20} 0.9343$, $n_D^{20} 1.5342$, M. R. 57.05, consisting of $p\text{-}$ and $m\text{-MeC}_6\text{H}_4\text{C}_6\text{H}_5$, identified as $p\text{-}$ and $m\text{-C}_6\text{H}_4(\text{CO}_2\text{Me})_2$, resp., and 18% $3,5\text{-Me}_2\text{C}_6\text{H}_3(\text{CO}_2\text{Me})_2$, m. 93.5° , identified as tri-Me trimesate. From the decomposition of $\text{C}_6\text{H}_5\text{OH}$ with AlCl_3 with the formation of 16-20% C_6H_5 and 20-5% $\text{C}_6\text{H}_5\text{Cl}$ it is assumed that by analogy with tertiary alcs.,

TSUKERVANIK, I. P.

Benzylstibine and its derivatives. I. P. Tsukervanik and D. Shadrin. *J. Gen. Chem.* (U. S. S. R.) 7, 1527-31 (1937). — PhCH_2MgCl and SbCl_3 in a CCl_4 atm. give tri-benzylstibine (I), m. 90° , which is easily oxidized by air, especially in soln., to tri-benzylstibine oxide (II). I reacts with Cl_2 and Br_2 , or II with HCl and HBr , to give the di-chloride m. $100-1^\circ$, and the dibromide m. $102-3^\circ$, resp. When I is heated with SbCl_3 , it forms $(\text{PhCH}_2)_3\text{SbCl}_2$, m. $187-8^\circ$, which gives with dil. Na_2CO_3 soln. $[(\text{PhCH}_2)_3\text{SbO}]_2$. With HBr this forms $(\text{PhCH}_2)_3\text{SbBr}_2$, m. $150-1^\circ$ (decomps.). H. M. Leicester

Condensation of alcohols with aromatic compounds in the presence of aluminum chloride. IX. Condensation of 1,2-methylcyclohexanol, menthol and borneol with benzene and toluene. I. P. Tsukervanik and N. G. Sidorova, *J. Gen. Chem.* (U.S.S.R.), 1960, 1962 (in English, 1962)(1968); cf. C. A. 33, 4587. The following compounds were prepd.: *methylcyclohexylbenzene*, $C_{11}H_{18}$ (42.8% yield), b_p 142.3°, d_4^{20} 0.8608, n_D^{20} 1.5290; *(methylcyclohexyl)toluene* isomers (50% yield), b_p 152.1°, d_4^{20} 0.8591, n_D^{20} 1.5205; *menthylbenzene* $C_{11}H_{18}$ (1) (51.5% yield), b_p 151.4°, d_4^{20} 0.8642, n_D^{20} 1.5207; *p*- and *m*-*menthyltoluene* (61% yield), b_p 183.8°, d_4^{20} 0.8244, n_D^{20} 1.5185; *bornylbenzene*, $C_{11}H_{18}$ (30% yield), b_p 165.8°, d_4^{20} 0.8535, n_D^{20} 1.5250; *p*- and *m*-*bornyltoluene* (64% yield), b_p 131.3°, d_4^{20} 0.8500, n_D^{20} 1.5275. In the prepn. of 1,3-menthene, b_p 165.0°, d_4^{20} 0.8103, n_D^{20} 1.4170, and *tert*-menthyl chloride, $C_{11}H_{21}Cl$, b_p 117.8°, d_4^{20} 0.8105, n_D^{20} 1.4070, were the chief products when insufficient $AlCl_3$ was used. Small amts. of polyalkylated hydrocarbons were always obtained but not identified. John Livak

PROCESSING AND PROPERTIES INDEX																			
<p>CA</p> <p>Reciprocal action of acetylketene and alcohols. 1. I. P. Tsukervanik and I. A. Ermolenko. <i>Bull. univ. Acad. sci. 22</i>, 215-20 (in German, 220) (1938).—The reaction between <i>acetylketene</i> and various alcs. and some other compds. has been investigated. The acetylation proceeds even in the cold in the absence of catalysts. The catalysts tested were quinoline, H_2SO_4, and $ZnCl_2$. Only in acetylating <i>glycerol</i> the presence of H_2SO_4 is of advantage. The reaction proceeds smoothly and the yield is almost theoretical in the case of primary and secondary alcs., whereas the acetylation of tertiary alcs. proceeds much more slowly. Glycerol and <i>glycol</i> give a mixt. of mono- and diacetates. Unsaturated alcs. react only with the HO group with the formation of normal acetates. The acetylation of <i>p-unsidine</i> gives 98% of pure acetate. <i>Aspirin</i> is obtained in 96% of the theoretical yield from <i>salicylic acid</i>.</p> <p>Gertrude Berend</p>

Condensation of aldehydes and ketones with aromatic hydrocarbons in the presence of anhydrous aluminum chloride. I. Condensation of aliphatic ketones with phenols. I. P. Tsukervanik and Z. N. Nazarova. *J. Gen. Chem. (U. S. S. R.)* 9, 83-5 (1939); cf. *C. A.* 31, 5778. The interaction of aliphatic ketones with PhOH in the presence of excess $AlCl_3$ (1.5 mols.) in the cold for 1-3 days yields dialkyl diphenolmethanes, which on heating decompose to give *p*-alkyl phenols. The latter are formed directly in 40% yield by condensation of the reaction mixt. on the water bath for 3-4 hrs. The mechanism of the condensation reaction is analogous to the similar procedure in the presence of fuming HCl studied by Diamm (*J. Russ. Phys.-Chem. Soc.* 23, 488, 523, 601 (1891); cf. *loc. cit.*). In this way were prepd. *isopropylphenol* (from Me_2CO and PhOH), b. 200-30° (and considerable resinification products) and *sec-amylphenol* (I) (from Et_2CO), m. 79°, b. 245-60° (*Re deriv.*, m. 48-50°). Me_2CO also formed I, b. 245-50°, d₄ 0.97, n_D 1.5215. It gives a *Re deriv.*, b. 340-50°, *Ac deriv.*, b. 251-5°, and *Me ether*, b. 232-8°, which with C_6H_5 is oxidized to anisic acid, m. 170°. Condensation of *m*-cresol with Me_2CO produced an anhydride, m. 131°, described by Zincke and Gaebel (*C. A.* 6, 1753). Chas. Blanc

Alkylation of aromatic hydrocarbons by dihalogen derivatives. I. Condensation of 1,3-chlorobromopropane with benzene. I. Tsukervanik and K. Vatsimirskii. *J. Gen. Chem.* (U. S. S. R.) 10, 1075 (1940). When $\text{Cl}(\text{CH}_2)_3\text{Br}$ and C_6H_6 react in the presence of AlCl_3 at $6-12^\circ$, 40% $\text{Ph}(\text{CH}_2)_3\text{Br}$ (I) is formed. At $80-5^\circ$, 60% $\text{Ph}(\text{CH}_2)_3\text{Ph}$ is formed, with some PhPr as a by-product, but no I is obtained. H. M. Leicester.

<p>The alkylation of aromatic compounds by alcohols in the presence of anhydrous ferric chloride. Z. N. Nazarov and I. P. Trukeryank, <i>J. Gen. Chem.</i> (U. S. S. R.) 10, 1181-5(1946).—Tertiary alcs. react easily at room temp. with C_6H_5, $MePh$, C_6H_5, $PhOH$, <i>m</i>- and <i>p</i>-cresols and $MeOPh$ to give 70-85% yields of monoalkyl derivs. in the presence of 0.5 equiv. $FeCl_3$ per equiv. of alc. If the mixt. is heated, some <i>p</i>-dialkyl compds. are also formed. With secondary alcs., a 1:1 mixt. of $FeCl_3$ and alc. is required and the mixt. must be heated to 50-60° to get 38-78% yields of <i>o</i>- and <i>p</i>-derivs. With primary alcs., rate of reaction depends on structure, branched-chain alcs. reacting faster than normal alcs. <p>The condensation of aromatic compounds with acids.</p> <p>1. Condensation with hydrocarbons, phenol and phenetole. I. Tsukervanik and I. Terent'eva. <i>J. Gen. Chem.</i> (U. S. S. R.) 10, 1103-7 (1940). — Iso-BuCO₂H (30 g.) in 100 cc. PhMe was treated with small portions of AlCl₃ (total 75 g.). After adding all the AlCl₃ the reaction mixt. was allowed to stand for 12 hrs. and then was heated in a water bath for 3-6 hrs. <i>p</i>-Methylisovalerophenone, obtained in 72% yield, b_m 224-5°, b_s 137°, d₄ 0.8574, n_D 1.5085, MR_D 54.39; semicarbazone, m. 215-16°; oxime, 65°. Oxidation of the product with 10 parts of 5% HNO₃ in a sealed tube for 10 hrs. yielded <i>p</i>-MeC₆H₄CO₂H. Condensation of PrCO₂H in PhMe in the presence of AlCl₃ under the same conditions yielded <i>p</i>-methylbutyrophene (72.5%), b. 248-50°, d₄ 0.9000, n_D 1.5232, MR_D 51.20; semicarbazone, m. 200-10°. On the oxidation of the product <i>p</i>-MeC₆H₄CO₂H was reprecipitated. Under the same conditions EtOPh condensed with iso-BuCO₂H in the presence of AlCl₃ yielding <i>p</i>-ethoxyisovalerophenone (82%), b_m 153-7°, d₄ 1.0406, n_D 1.5533, MR_D 61.01 (semicarbazone, m. 191-2°; oxime, m. 118-19°); and <i>p</i>-hydroxyisovalerophenone (9%) m. 95-6°. Phenetole with PrCO₂H yielded <i>p</i>-ethoxybutyrophene (76%), b. 129°, n_D 1.5300, MR_D 57.03 (semicarbazone, m. 181°; oxime, m. 103-4°), and <i>p</i>-hydroxybutyrophene, m. 91-2° (semicarbazone, m. 107-9°; oxime, m. 83-4°). The condensation of PhOH with iso-BuCO₂H in C₆H₆ under the same conditions yielded <i>p</i>- and <i>o</i>-hydroxyisovalerophenones (total yield 63%); the <i>o</i>-deriv. b. 248-50°, d₄ 1.0197, n_D 1.5120, MR_D 52.99. Condensation of alcohols with aromatic hydrocarbons in the presence of aluminum chloride. Condensation of cycloheptanol with benzene and toluene. N. G. Sidorova and I. E. Zhukeravnik. *J. Gen. Chem.* (U.S.S.R.) 10, 2073-6 (1940). - A yield of 40-50% of cycloheptylbenzene (I) and cycloheptyltoluene (II) was obtained on condensation of cycloheptanol (III) with benzene (IV) and toluene (V). III was prepd. by the reduction of cycloheptanone by the method of Mosettig and Burger (c. 1, 24, 4767); 10 g. of III, 12 g. AlCl₃ and 100 ml. IV yielded 7 g. I, b_p 132.5°, d₄²⁰ 0.9410, n_D²⁰ 1.5217, M_RD 50.42, calcd. 50.43. Oxidizing I with 15% HNO₃ in sealed tubes at 140-160° yielded IIaOH, m. 119°. *p*-Cycloheptylnitrobenzene (VI) was obtained on nitrating I with a nitration mixt. VI b_p 203-10°. Oxidizing VI with 15% HNO₃ in sealed tubes gave *p*-O₂NC₆H₄CO₂H, m. 240°. The *p*-amino deriv. (VII) of I was obtained on reduction of VI with Sn and HCl, and was purified by steam distn. The benzoate of VII (from alc.) m. 173°; acetate (from derivs. of phenylcyclohexylmethane (VIII) and 1-methyl-2-phenylcyclohexane (IX), which were specially prepd., differed from the derivs. of I. *Synthesis of VIII.* Phenylcyclohexylcarbinol (X) was obtained by Grignard's reaction from 10 g. Mg, 68 g. bromocyclohexane, 2.4 g. BuH in 100 ml. of abs. ether. The yield was 34.5 g. (45.5%), b_p 130-42°. Ph cyclohexyl ketone (XI) was formed by the oxidation of X. To 34.5 g. of the heated X was added dropwise 18.5 g. Na₂Cr₂O₇ in 45 ml. of H₂O and 13 ml. H₂SO₄. The reaction product was acid. with ether. After the ether was evapd. thin needles of XI, m. 54°, were obtained. The yield was 31 g. (91%). Phenylcyclohexylmethane (XII) was obtained by the reduction of XI by the Clemmensen method. The yield was 52%, b_p 137°, d₄²⁰ 0.9436, n_D²⁰ 1.5255, M_RD 50.58, calcd. 50.40. The (nitrophenyl)cyclohexyl ethane, b_p 18°, with Sn and HCl. The *N*-H₂ deriv. (from dil. alc.) m. 101-2°. The *N*-Ac deriv. (from dil. alc.) m. 150-1°. *Synthesis of IX.* 3-Methyl-2-phenylcyclohexene (XIII) was obtained by Grignard's reaction from 1 g. Mg, 20 g. bromobenzene and 18 g. of 2-methylcyclohexanone in 50 ml. of abs. ether. The yield was 12 g. (42%), b_p 112-15°. 1-Methyl-2-phenylcyclohexane (XIV) was obtained on heating 12 g. of XIII with 12.5 ml. H₂ (d. 1.7) and 0.75 g. of red P in a sealed tube, for 6 hrs., at 160-200°. XIV b_p 91-2°, d₄²⁰ 0.9590, n_D²⁰ 1.5500, M_RD 50.75, calcd. 50.60. The nitro and the corresponding amino compds. were obtained from XIV by the usual method. The *N*-H₂ deriv., m. 100-11°. The *N*-Ac deriv. was a liquid, b_p 195-200°. It was obtained on treating 5 g. of III with 50 ml. of V and 6 g. of AlCl₃. The yield was 4 g. of II (a mixt. of *m*- and *p*-isomers), b_p 110-12°, d₄²⁰ 0.9350, n_D²⁰ 1.5265, M_RD 50.81, calcd. 51.05. It oxidized with dil. HNO₃ yielded a mixt. of *tert*- and isophthalic acids, which were obtained by their di-Me esters. The conclusion is drawn that the condensation of III with IV and V proceeds only to a small extent.

James J. Lichin

ca 10

Alkylation of aromatic compounds with alcohols in the presence of anhydrous FeCl_3 . Z. N. Nazarova and I. P. Tsuberevskiy, *J. Gen. Chem.* (U. S. S. R.) 14, 77 (1944) (Russian summary).—Attempts to effect a condensation between benzene and PhOH on one hand and primary alcs. (EtOH , PrOH and BuOH) on the other hand failed to give more than traces of alkaryl derivs. PhCH_2OH (30 g.), benzene (50 g.) and 32 g. FeCl_3 heated to 70° for 4 hrs. gave 58% PhCH_3 , b. $200-5^\circ$, m. 27° . PhCH_2OH (20 g.), PhOH (30 g.) and 15 g. FeCl_3 mixed, let stand for 24 hrs. and heated on a steam bath for 2 hrs. gave 58% *benzylphenol*, b. $300-30^\circ$, m. 82° . Allyl alc. (15 g.), 40 g. benzene and 20 g. FeCl_3 were mixed with cooling, let stand for 24 hrs. and finally heated for 2-3 hrs. on a steam bath to 100° to yield 8% crude *allylbenzene* and 52% (*2-chloropropyl*)benzene; the purified compds. had the following consts., resp.: b. $154-6^\circ$, n_D^{20} 1.5110, d_4^{20} 0.8600, and b.m. $200-5^\circ$, n_D^{20} 1.5147, d_4^{20} 1.0249. This reaction conducted at room temp. (3 days' standing) gave the 2 products in reverse ratio: 33% and 8%, resp. Allylbenzene yields a *tribromide*, m. 118° . Similarly, PhMe gave *allyltoluene*, b. $178-80^\circ$, n_D^{20} 1.5085, d_4^{20} 0.8618, and (*2-chloropropyl*)toluene, b. $220-30^\circ$, n_D^{20} 1.5194, d_4^{20} 0.8654. G. M. Kosolapoff

<p>Condensation of alcohols with aromatic compounds in the presence of aluminum chloride. XI. Mechanism of alkylation of aromatic hydrocarbons by alcohols. I. P. Esakryanik (Middle Asiatic State Univ.). J. Gen. Chem. (U.S.S.R.) 15, 635-8(1945) (English summary).</p>		<p>10</p>
<p>ca</p>	<p>The cleavage of reaction products of alcs. with $AlCl_3$ was studied at temps. above 100°; contrary to Norris and Sturgis (C.I. 33, 623P), only low yields of alkyl chlorides were obtained. It was shown that addn. of 5-10% $FeCl_3$ to $AlCl_3$ markedly raises the yield of RCl on cleavage of the $AlCl_3 \cdot OR$. $PrOH$ (23 g.) was added over 5 hrs. to 67 g. $AlCl_3$; vigorous evolution of HCl was observed and the resulting solid was slowly heated to 155° with collection of the distillate in a well-cooled receiver; there were obtained 37% $PrCl$ and 3 g. $EtCl$. Similarly, $iso-PrOH$ gave 25% $iso-PrCl$ and $PrOH$ gave 10% $PrCl$ (at $115-20^\circ$). $EtOH$ (23 g.) was similarly added to 64 g. $AlCl_3$ and 3.5 g. $FeCl_3$; the resulting mass m. 100°, while heating to 125° produced foaming and evolution of $EtCl$, with the reaction being complete at 150°; there was obtained 70% $EtCl$. Use of 60 g. $AlCl_3$ and 7 g. $FeCl_3$ as above gave 96% $EtCl$. $iso-PrOH$ (12 g.), 20 g. $AlCl_3$, and 3 g. $FeCl_3$ gave 73% $iso-PrCl$; 30 g. $PrOH$, 60 g. $AlCl_3$, and 7 g. $FeCl_3$ gave 54% $PrCl$, while 37 g. $BuOH$, 60 g. $AlCl_3$, and 7 g. $FeCl_3$ gave 10% $BuCl$. $iso-AmOH$ failed to yield $iso-AmCl$. $AlCl_3$ (30 g.) was slowly added to 20 cc. $iso-BuOH$ in 50 cc. CS_2 with cooling, after which the mass was warmed on a water bath until the HCl evolution ceased and 2 layers formed; the top layer on cooling gave a crop of colorless crystals of $iso-BuOAlCl_2$ (22.5%); use of petr. ether instead of CS_2 gave an analogous result with a 32% yield of the product; treatment of this with water gave $iso-BuOH$, while addn. of 20 g. of the complex to 30 cc. benzene and 20 cc. $AcCl$ gave 60% $PhAc$ (the reaction was run with effective cooling); similar reaction with $BzCl$ gave 50% $PhCO_2$.</p>	<p>MBR., LAB. <p>Alkylation of aromatic compounds in the presence of phosphoric acid. I. Condensation of alcohols with aromatic hydrocarbons and halides. I. P. Tsukervanik (Middle Asiatic State Univ.). <i>J. Gen. Chem.</i> (U.S.S.R.) 15, 599-703 (1945) (English summary).—It was shown that H_3PO_4 may be used for alkylation of aromatic compds. by alc., with yields up to 90-95% being obtained in the best cases. Considerable poly-substitution occurs, <i>p</i>-isomers predominating in disubstituted products, with occasional traces of the <i>o</i>-isomers. The iso alcs. usually isomerize into tertiary radicals. The mixt. of aromatic compd. and H_3PO_4 was treated, with stirring, with the alc. which was added slowly, and the mixt. was heated and stirred for 6-10 hrs.; on cooling, the org. layers were fractionated. Thus, 100 cc. benzene, 37 g. iso-BuOH, and 110 cc. H_3PO_4 (d. 1.85) gave, after 10 hrs. at 90°, 3 g. PhH; b. 165-70°, with almost all benzene being recoverable; the use of toluene and iso-AmOH as above gave 30% mixed amyltoluenes, principally <i>p</i>-AmC₆H₄Me, b. 204-6°. Toluene and iso-BuOH gave 56% mixed butyltoluenes, principally <i>p</i>-<i>tert</i>-BuC₆H₄Me, b. 193-6°. Toluene and iso-PrOH gave 80% <i>p</i>-cymene; toluene and EtOH gave a very low yield of ethyltoluene, b. 157-60°. Toluene and allyl alc. gave 10% allyltoluene, b. 183-6°, and 40% diallyltoluene, b. 302-7°. Toluene (75 cc.), 46 g. BuCl, and 110 cc. H_3PO_4, after 12 hrs. at 90°, gave 15% butyltoluene isomers, b. 185-95°, while <i>tert</i>-BuBr gave 37% <i>p</i>-Me₂C₆H₃Me. PhBr (80 g.), 37 g. iso-BuOH, and 100 cc. H_3PO_4 gave, after 8 hrs. at 120-30°, 30% BuC₆H₄Br; a higher temp. gave a higher yield but also caused much tar formation; the use of PhCl gave 30% <i>p</i>-Me₂C₆H₃Cl, b. 210-12°, while PhCl and <i>n</i>-PrOH gave 90% mixed propylchlorobenzenes, b. 185-95°, with a considerable amt. of <i>p</i>-PrC₆H₄Cl, b. 190-2°. Benzene and borneol at 70° (10 hrs.) gave 25% bornylbenzene, b. 145-8°.</p> <p style="text-align: right;">(I. M. Kasolapoff)</p> <p>mbr., LAB. Alkylation of aromatic compounds in the presence of phosphoric acid. II. Alkylation of phenol and anisole by alcohols. V. Tsimbovitsva and L. Tsukervanik. *Gen. Chem. (U.S.S.R.)* 15, 830-11(1945); cf. C.A. 40, 5707. - PhOH and PhOMe were condensed in the presence of 1.5 mols. 95% H₃PO₄ with *tert*-AmOH at 70-81°, with *iso*-PrOH and *iso*-BuOH at 80-100°, and with PhOH and BuOH at 100-30° to form 80-95% of the corresponding *p*-alkyl derivs. and sometimes a small amt. of the *o*-derivs. Below these temps., reaction did not occur. During the condensation, primary groups isomerized to secondary, and secondary to tertiary. Isolation of PhO(OBu)O₂Ha from one reaction mixt. indicates that the reaction goes through the formation of acid esters of H₃PO₄, which are in turn the alkylating agents. With PhOMe both *Pr* and *iso*-*Pr* alic. yielded *p*-isopropylanisole, *b_{mp}* 212-14°, *d₄* 0.9118, *n_D* 1.5070, and *o*-isopropylanisole, *b_{mp}* 198-200°, *d₄* 0.9540, *n_D* 1.5050. Similarly, *Pr* and *iso*-*Pr* alic. and phenol yielded the corresponding *p*-*iso*-*Pr* deriv., *b_{mp}* 213-14°, *d₄* 1.0157, *n_D* 1.5092, and *o*-*iso*-*Pr* deriv., crystals, *m.* 61°. Other compds. prepd. were *p*-*tert*-butylanisole, *b_{mp}* 211-15°, *d₄* 0.9135, *n_D* 1.5090, and *p*-*tert*-butylphenol, crystals, *m.* 90° (from *iso*-BuOH), and *p*-*tert*-butylanisole, *b_{mp}* 198-10°, *d₄* 0.9110, *n_D* 1.5030 (from BuOH). 10		Activity of halogen in organic compounds in Friedel-Crafts syntheses. I. Condensation of ethyl esters of aliphatic halogen-substituted acids with benzene. I. P. Tsukervanik and I. V. Terent'eva. Doklady Akad. Nauk S.S.S.R. 50, 257-60(1945).—The position of Cl determines the nature of the products from the Friedel-Crafts reaction of C_6H_6 with esters of halo aliphatic acids; the activity of Cl rises with increased distance from the COO group. C_6H_6 (100 ml.), 40.5 g. EtO_2CCH_2Cl , and 68 g. $AlCl_3$, after standing 24 hrs., boiling 1.5 hrs., and heating 5 hrs. on a steam bath, gave 70% mixed hydrocarbons from which $EtPh$, a mixt. of isomeric $Et_2C_6H_5$, and 1,2,4- $Et_3C_6H_3$, were isolated: the latter gave 1,2,4- $C_6H_3(CO_2H)_3$, m. 215-18°, after oxidation by HNO_3 at 165-70°. C_6H_6 (100 ml.), 34 g. $EtO_2CCH_2CH_2Cl$, and 70 g. $AlCl_3$, after 24 hrs. standing and 6 hrs. at 80°, gave 68% $PhCH_2CH_2CO_2H$ (m. 49°, b. 280°), 7 g. $EtPh$, and 12 g. $PhCOCH_2CH_2Cl$ (b. 255-56°, n_D^{20} 1.4822, d_4^{20} 1.0063); merely letting the mixt. stand 14 days gave only 74% $PhCH_2CH_2CO_2H$ and $EtPh$. C_6H_6 (50 ml.), 9 g. $EtO_2C(CH_2)_3Cl$, and 20 g. $AlCl_3$ let stand 30 hrs., kept 12 hrs. at 60-70°, and boiled 3 hrs. gave 2 g. $EtPh$, 4 g. $Ph(CH_2)_3CO_2H$, m. 51°, and 4.5 g. 3,4-dihydro-1(2H)-naphthalenone, b.p. 132-4°, n_D^{20} 1.5095, d_4^{20} 1.0095. (Radikal'noye i ionnoye alkilirovaniye aromaticeskogo yadra) VII. Butylation of Benzene, Naphthalene, Phenol, and Anisole (VII. Butilirovaniye benzola, naftalina, fenola i anizola)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol. 28, Nr 8, pp. 2032-2038 (USSR)

ABSTRACT: In connection with a previous paper (Ref 1) this paper attempts to explain the peculiarity of the alkylation of different compounds with n-butyl chloride in the presence of copper. As an example the free radical butylation of anisole was investigated. n-Butylphenyltriazenes were used as the source of free butyl radicals. In contrast to the benzylation and the reaction with diphenylchloromethane the butylation with copper proceeds much more difficultly (at 200-250°). In reacting n-butylchloride with benzene, naphthalene, phenol, and anisole the corresponding monobutyl and dibutyl aromatic compounds resulted, and in the case of phenol a butyl ether

Card 1/3

Radical and Ionic Alkylation of the Aromatic Nucleus. SOV/79-28-8-7/66
VII. Butylation of Benzene, Naphthalene, Phenol and, Anisole

of the butylphenol also resulted. Side products could not be determined. In every case it was the secondary butyl derivative which was produced. The proof of the structures was carried out by perbrominating and oxidizing. It was found that the alkylation product yield in the above reactions was 38-87 %. Thermal butylation also yielded alkyl derivatives. Under the experimental conditions used an isomerization of the primary butyl group to the secondary form always took place. The butylation of phenol follows the mechanism of indirect nuclear alkylation. Free butyl radicals produced by the thermal decomposition of n-butylphenyltriazene can be used to alkylate the anisole nucleus. There are 4 tables and 35 references, 11 of which are Soviet.

TITLE: Condensations of Benzotrichloride With Benzene in the Presence of Aluminum Chloride (Kondensatsii benzotrikhlorda s benzolom v prisutstvii khloristogo alyuminiya)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol. 28, Nr 8, pp. 2038-2042 (USSR)

ABSTRACT: The authors investigated the condensations of benzotrichloride with benzene in order to produce the various substitutions of the chloride atom and to ascertain the conditions under which triphenylmethane and 9-phenylfluorene form. It was found that the amount of $AlCl_3$ present is a definite factor in this synthesis. Using 0,1 mole $AlCl_3$ (to 1 mole benzotrichloride), and independent of the temperature ($15-90^\circ$) and the reagent concentration, a yield of 70 % diphenyldichloromethane was obtained with a small side product of triphenylchloromethane. With 1 mole of $AlCl_3$ triphenylchloromethane was produced as the main product with a yield of 80-98 %. Further increases in the amount of $AlCl_3$ caused a hardening reaction and a decrease in the triphenylchloromethane yield. Other factors in this synthesis were studied, among them
